Electronics

PolyIC – The chip printers

Printed electronics make

- Thin and flexible
- Inexpensive and simple
- Pervasive and disposable

Electronics come true

Challenges

Parameters to achieve high performance and reliable printed electronics

- Often simplified to
 - ◆ single parameters (e.g. mobility or channel length)
 - ◆ simple functionality (e.g. transistor performance)
- Optimization of single parameters influence the whole system

- Complex system of about 40 parameters
 - to be measured, managed and optimized

Four Dimensions of controlled parameters

Four Dimensions of controlled parameters

Logics

- Basic Components
- Circuit concepts
- Circuit Modeling and Simulation

Chemical/ Material

- Mobility, Work function
- contact resistance
- Regioregularity, Mol-weight
- Adequate solvents

Physics

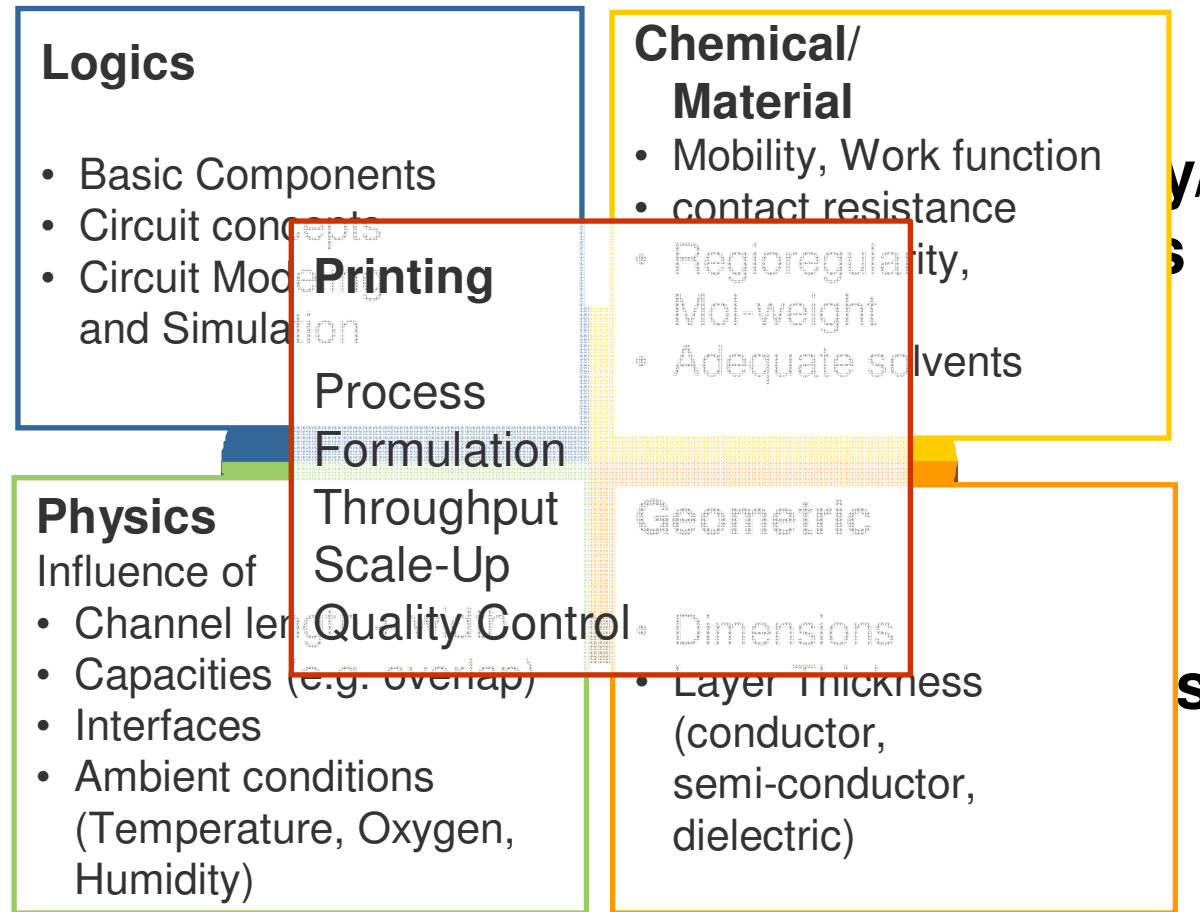

Influence of

- Channel length + width
- Capacities (e.g. overlap)
- Interfaces
- Ambient conditions (Temperature, Oxygen, Humidity)

Geometric

- Dimensions
- Layer Thickness (conductor, semi-conductor, dielectric)

Next level of complexity - Printing

Understanding and Optimizing a model for Printed Electronics

■ Target of PolyIC

- ◆ Understand the parameters and their influence
- ◆ Build a system model
- ◆ Optimize the model for future circuits
- ◆ Extend the model to printing processes

■ Progress

- ◆ Performance
- ◆ Components per Circuit
- ◆ Milestones to Application: Approaching Printed RFID

Parameters are identified and developed for the 1st generation of products

Logics developed

- Simulation and Modeling Software developed
- Polymer based circuits for RFID tags demonstrated (125kHz, 13.56 MHz, 8Bit@7.5cm)

Chemistry /

Materials identified

- Identified 1st Generation Material Set
 - Polythiophen
 - Polyester
 - conducting and insulating materials

Physical Parameters identified

- Lifetime >> several month
- Survived 85/85/85 test
- Circuits work at LowVoltage (10-20V)

Geometrical parameters achieved

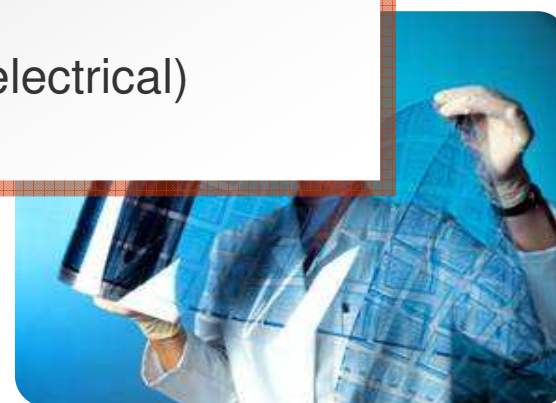

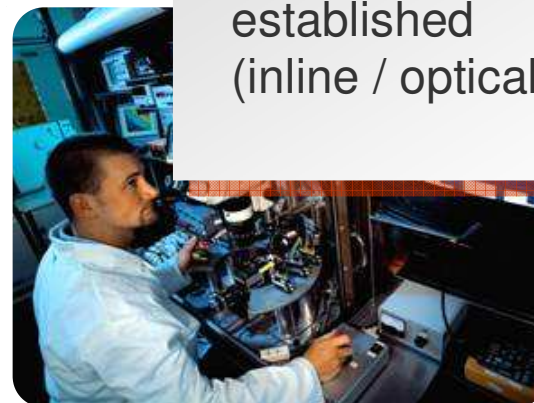

- < 20 μ channel
- Overlaps
- Layer thickness
- Registration

Parameters are identified and developed for the 1st generation of products

Printing process identified

- Combined, continuous Roll2Roll Processes (Min. 20m/min)
- First methods for Quality Control established (inline / optical / electrical)

The Fabrication of Polymer ICs at PolyIC

Clean room

Lab printing

Production process

Technology	Spin Coating Photo Lithography Evaporation Wet Etching ...	Pad Printing Doctor Blade Gravure Printing Screen Printing ...	Flexographic Printing Offset Printing Gravure Printing Screen Printing ...
Results	Fast Circuits & Rectifiers High Yield & Stability RFID Demonstrators	Printed Transistors Printed Inverters Printed Ring Oscillators	Printed RFID Tags: Prototypes 2006 First products 2007
Goal	Development of Chip Design and Materials	Identify & Test Formulation for Printing Process	Low cost high volume Product\$

Milestones to Application: Approaching printed RFID

PolyIC presents Miles of printed MHz Tags

- Prototype
13.56 MHz RF Tags
 - ◆ full flexible and thin
 - ◆ Roll-to-Roll manufactured with adapted printing processes
High Speed (up to 20m/min)

- Roll-to-Roll printed logic circuits
 - ◆ Ring Oscillators
(needed for 13.56MHz RFID Tags)
- First demonstration and show at OEC06
Sep 25-27, Frankfurt

Polymer 8-Bit 13.56 MHz RFID-Tag with 7.5 cm reading distance

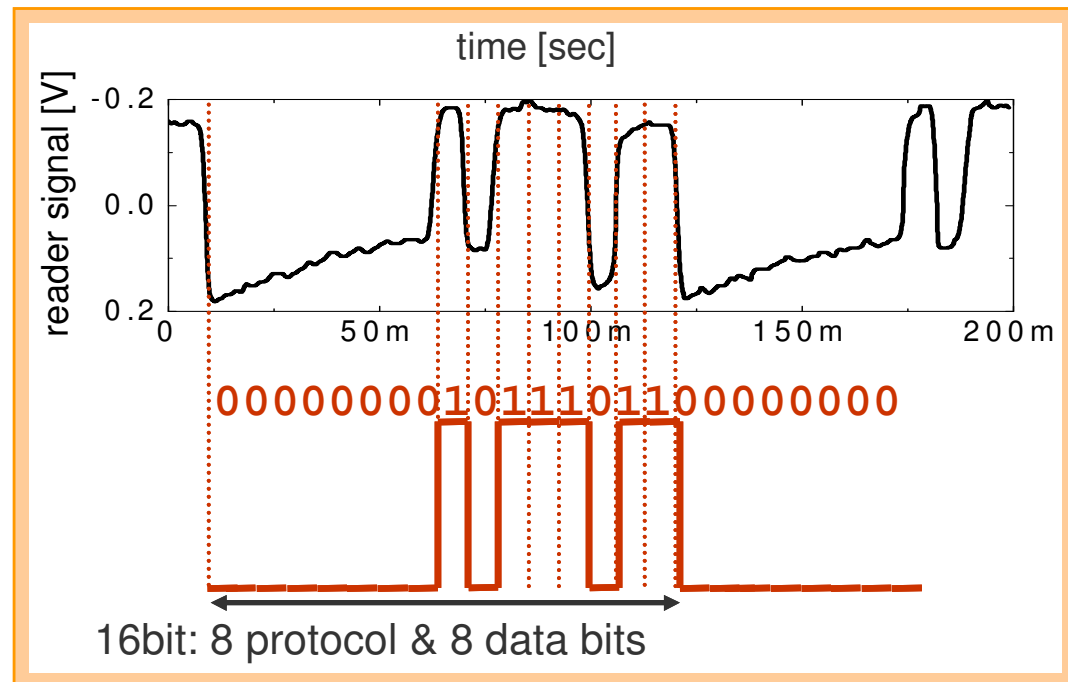

Inductive coupled RFID Tag with 13.56 MHz rectifier, clock generator, counter, multiplexer, 8-bit ROM and modulator:

- 16 Bit: 8 protocol & 8 data bits: 00000000-10111011
- ~0.1 s read time
- 7.5 cm reading distance
- measured 3 month after fabrication

All layers and devices are made of polymers except antenna, tracks and electrodes

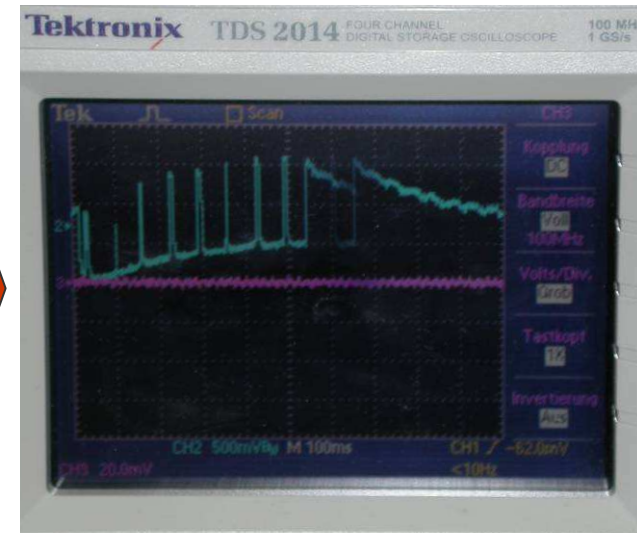

Reader operating with only 1.2 W power supply (allowed 2 W)

Polymer 64-Bit 13.56 MHz RFID-Tag with 3 cm reading distance, inductive coupled

64-Bit Chip Output signal ($U_{\text{supply}} -16\text{V}$)

Demodulated reader signal ($U_{\text{supply}} -14\text{V}$)

RFID - Tag & Reader

Detail:

- 64 Data bit followed by 64 "Zero" - bits
- Bit width: 6.5ms \rightarrow 420ms @ -16V for 64-bit
- Bit width: 8ms \rightarrow 520ms @ -14V for 64-bit
- Chip area $\sim 35\text{mm}^2$
- Supply voltage min. -14V
- Reader / RFID distance $\sim 3\text{cm}$

PolyIC – The chip printers

Printed electronics make

- Thin and flexible
- Inexpensive and simple
- Pervasive and disposable

Electronics come true

Applications

Printed Electronics open new markets

Why Printed RFID?

First
Products

Content Verification

- ◆ Check if a box contains a product

Electronic Authentication

- ◆ Check if a product is a counterfeit

Future
Products

Tracking & Tracing

- ◆ Track a product through the supply chain from production to the retail store

Inventory Control

- ◆ Acquire product data automatically without human interaction

Our two product line trademarks: PolyID™ and PolyLogo™

POLYID

■ RFID

PolyIC – product line PolyID:

POLYID

POLYLOGO

■ Smart Objects and Display

PolyIC – product line PolyLogo:

POLYLOGO

Our long term target applications: PolyID™: EPC – PolyLogo™: Smart Cards

POLYID

EPC™ (Electronic Product Code)

- ◆ Applications
 - ◆ Item Level Tagging
 - ◆ Supply chain
 - ◆ Inventory Control

POLYLOGO

Smart card / Intelligent sensor

- ◆ Applications
 - ◆ Single use sensors
 - ◆ Combined optical / RFID function
 - ◆ smart package
